FOOD CONSUMPTION OF HOUSEHOLDS IN THE UNITED STATES, SPRING 1965,
I₁-A Preliminary Report-X

U. S. DEPT. OF AGRICULTURE
NATIONAL AGRICULTURAL LIBRARY
OCT 22 1967
CURRENT SERIAL RECORDS

United States Department of Agriculture
Agricultural Research Service

This is the second preliminary report from the nationwide food consumption survey made in 1965-66 by the Consumer and Food Economics Research Division of the Agricultural Research Service. The first findings appeared in a preliminary report, "Money Value of Food Used by Households in the United States, Spring 1965," which was published in September 1966. This second report presents some tables and findings on the quantity and money value of foods used by U.S. households in the spring of 1965. The information was collected by National Analysts, Inc. and tabulated by General Electric Co. under contracts with the Department.

LIST OF TABLES

<u>Table No.</u>	<u>Page</u>
Food used at home: Quantity and money value of food per household per week	
1. Milk, cream, cheese-----	8
2. Fats, oils-----	10
3. Flour, cereal; bakery products-----	12
4. Meat; poultry, fish, shellfish; eggs -----	14
5. Sugar, sweets; potatoes, sweetpotatoes -----	16
6. Fresh vegetables -----	18
7. Fresh fruit; commercially canned and frozen vegetables and fruit-----	20
8. Juice, vegetable and fruit; dried vegetables and fruit -----	22
9. Beverages; soup, other mixtures-----	24
10. Nuts, condiments, leavenings -----	26

FOOD CONSUMPTION OF HOUSEHOLDS IN THE UNITED STATES, SPRING 1965
--A Preliminary Report--

by
Consumer and Food Economics Research Division
Agricultural Research Service
United States Department of Agriculture

Housekeeping households in the United States used food at home with an average money value of \$29 in a week in the spring of 1965. The largest portion of the food dollar, 36 cents, went for meat, poultry, fish, and eggs and the next largest, 19 cents, for vegetables and fruit including juices. About 13 cents went to milk and milk products other than butter; another 12 cents out of each dollar was allotted to flour, cereals and bakery products; and 10 cents, was spent for beverages other than milk and juice (coffee, tea, soft drinks, punches, ades, beverage powders, and alcoholic beverages). Fats, sweets, and all other foods took the remaining money.

The average of \$29 per week for the Nation as a whole provided the following selection of foods per person per day: 10-1/2 ounces of meat, poultry, and fish (enough for about two servings a day); about one egg; nearly 2-1/2 cups of milk or its equivalent in milk products (in terms of calcium content); nearly 4 ounces of potatoes and sweet-potatoes; a little over one pound of vegetables and fruit, including juices; about 3-1/2 slices of bread and 2-1/4 ounces of other bakery products; about 3 ounces of flour and other cereal products; 2-1/2 ounces of sugar and other sweets; nearly 2 ounces of fats, oils, and salad dressings; plus beverages, nuts, mixtures, and condiments.

Urbanization Differences

The division of the food dollar (expenditures for purchased food plus money value of nonpurchased food) was similar for urban and for rural families as shown by the following percentages:

	Urban	Rural nonfarm	Rural farm
Meat, poultry, fish, eggs-----	36	34	35
Vegetables, fruit-----	18	19	20
Milk, cream, cheese -----	12	13	14
Grain products -----	12	12	11
Beverages-----	10	9	7
Other-----	12	13	13
Total -----	100	100	100

However, there were some differences. Farm families allotted a slightly higher proportion of their food dollar to vegetables and fruit and to milk products, and a lower proportion to beverages than did urban families. Rural nonfarm families generally fell between the farm and urban groups.

The quantities of food used reflect further differences related to urbanization. Farm families used more milk and milk products, with a slightly higher proportion of it as fresh fluid milk. They also used more flour, fat, sugar, and eggs--probably reflecting more home baking than urban families. Urban families used more products with built-in maid service. They used more bakery products, commercially prepared soups and other mixtures, beverages, and commercially canned and frozen vegetables and fruit.

Regional Differences

The part of the country in which families live had little relation to the way they divided their food dollars. However, there were some differences in quantities of food used at home among the four broad regions used for classification in this survey. Households in the South had the lowest average consumption of milk and milk products. They also used the least fruit, but the most vegetables; the least bread but the most flour, sugar, fat, and eggs--indicating more home baking than the other regions. The Northeast used the most bakery products and the least flour and cereals, indicating less home baking than the other regions. The Northeast households were also the highest users of fruit. Families in the North Central Region consumed the most potatoes and fresh fluid milk.

Average quantities of meat, poultry, and fish used per person were about the same for all four regions, but choices within the group varied as follows:

	<u>Percent of quantity</u>			
	North			
	<u>Northeast</u>	<u>Central</u>	<u>West</u>	<u>South</u>
Beef -----	35	39	41	32
Pork -----	21	25	21	26
Poultry -----	19	17	18	20
Lunch meat -----	10	11	9	9
Fish, shellfish ----	8	6	7	10
Other meat -----	7	2	4	3
All meat, poultry, fish -----	100	100	100	100

Families in the South used a larger share of the total as pork, poultry, and fish and a smaller share as beef than those in the other regions. Western families used the most as beef, whereas North Central families used the most as lunch meat and the least as fish.

Income Differences

Food consumption has generally shown a closer relation to income for urban than farm families. However, in spring 1965, urban and farm families were fairly similar in this respect. Families at successively higher income levels, whether in cities or on farms, tended to use larger per capita quantities of meat, poultry, and fish, milk and milk products, vegetables and fruit, beverages, and mixtures, even though household size tended to increase with income. Higher income families also used more bakery products and less flour and cereals, and sugar and sweets than lower income ones, reflecting a preference for purchasing rather than baking their own products.

The division of the food dollar among different groups of foods was similar at all income levels for both urban and farm households. (See page 3 for the division of the food dollar by urbanization.)

Comparison With 1955 Survey

Since 1955 when the USDA made a similar nationwide food consumption survey there was a slight change in the proportion of food money homemakers allotted to different categories of food, as shown by the following percentages:

	<u>1955</u>	<u>1965</u>
Meat, poultry, fish-----	36	36
Vegetables, fruit-----	19	19
Milk, cream, cheese-----	15	13
Grain products-----	10	12
Beverages-----	8	10
Other-----	<u>12</u>	<u>10</u>
Total-----	100	100

Changes from 1955 to 1965 were a decrease in the proportion of the food dollar going to milk and milk products; an increase in the proportion going to grain products because of more purchases of bakery products; and an increase in the proportion going for beverages such as soft drinks, punches, ades, and beverage powders.

The principal differences in household food use in the decade between the 1955 and 1965 surveys were increases in use of bakery products, meat, poultry, and fish, and soups and other mixtures and decreases in other food groups as shown by the following:

	Quantity per household per week		1965 as percent of 1955
	1955	1965	
Milk, cream, cheese (calcium equivalent) -----(quarts)--	14.82	13.39	90
Fats, oils -----(pounds)--	2.97	2.70	91
Flour, cereal -----do----	5.87	4.69	80
Bakery products -----do----	6.70	7.63	114
Meat, poultry, fish -----do----	13.77	15.08	110
Sugar, sweets -----do----	4.15	3.70	89
Potatoes, sweetpotatoes -----do----	6.23	5.37	86
Other vegetables, fruit -----do----	27.14	25.16	93
Soup, other mixtures -----do----	1.53	1.95	127
Household size (21 meals at home = 1 person) -----(persons)--	3.33	3.29	99

Some of the changes in food consumption between 1955 and 1965 reflect a shift to foods requiring less preparation by the homemaker. Use of fresh citrus fruit decreased whereas use of frozen and chilled juices and lemonade increased. Other similar shifts were from fresh to frozen vegetables, from fresh to processed potatoes, and from flour and mixes to purchased bakery products.

Some changes may reflect an increased concern about consumption of fats or particular kinds of fat. Consumption of fresh whole milk and cream, evaporated milk, butter, and shortening decreased while that of fresh skim milk, nonfat dry milk, margarine, and oil increased.

Greater popularity of snacks is evident. This may be related to the increased proportion of children, especially teenagers, in the population. From 1955 to 1965 consumption increased for soft drinks, punches and ades, potato chips, crackers, cookies, doughnuts, ice cream, candy, and peanut butter.

Scope and Nature of Survey

In this survey, approximately 7,500 housekeeping households of one or more members throughout the United States were interviewed during the spring (April, May, June) of 1965. In each of the other three seasons (summer 1965, fall 1965, and winter 1966) of the nationwide survey, about 2,500 households were studied; thus over 15,000 households were surveyed.

The households reported quantities of all foods used at home and expenditures for the purchased items used during the 7 days preceding the interview. Home-produced food and food received as gifts and as pay were valued at average prices paid for similar items by other households in the same region and urbanization. Respondents also reported expenditures for meals and snacks away from home (not included in this

report), and provided information on various family characteristics needed for classification. In addition, data were collected on the 1-day diets of about 14,500 individuals in households interviewed in the spring.

The Department of Agriculture made similar nationwide surveys of household food consumption in 1936, 1942, 1948 (urban only), and 1955. The 1965-66 survey is the first to include nationwide data on diets of individual family members and on household food consumption for all seasons of the year.

Report Plans

Final reports will be released in a special publication series. The first 10 reports will be comparable to the first 10 reports from the 1955 survey. They will deal with the spring 1965 data and will comprise the following two sets of reports:

Reports 1-5 Food Consumption of Households--Contents will include the quantity, money value, and percentage of households using major groups, subgroups, and selected items of food. Where pertinent, these data will be shown separately for purchased food as well as for all food used at home.

Reports 6-10 Dietary Levels of Households--Contents will include the average nutritive value of the food used at home; the percentage of households with diets reaching specified levels of each nutrient; the nutrient contribution of selected groups of food; and the average quantity, money value, and percentage of households using food--arranged in nutritionally meaningful groups.

In each of the two sets of reports outlined above, there are to be separate volumes for the United States and for each of the four Census regions--Northeast, North Central, South, and West. In each of the 10 volumes, the data will be shown by income for three urbanizations--urban, rural nonfarm, and rural farm--and for all urbanizations combined.

Later there will be reports based on the household data collected over the 12-month period, April 1965 through March 1966. These volumes will provide information on household food consumption and on dietary levels for the entire year and for each season.

Further reports will be concerned with the seasonal use of home-produced and home-preserved foods; the food consumption and dietary levels of households which differ in the money value of their food; and the impact of such socioeconomic factors as the size of the household and the homemaker's age, education, and employment away from home. In addition, there will be one or more reports presenting information on the average food and nutrient intake of individuals during the spring of 1965.

Official Business

Footnotes

Note: Averages are based on all households in cell. Totals may include some items not shown separately.

1/ Total number of meals served to all persons from home food supplies divided by 21.

2/ Quantity of whole fluid milk to which dairy products (except butter) are equivalent in calcium.

3/ Includes households not classified by income.

4/ Includes dough, batter, and partially baked products.

5/ In-shell equivalent of liquid eggs (yolks, whites, mixed yolks and whites) and processed eggs.

6/ Includes home-canned and home-frozen items.

7/ Includes single-strength equivalent of frozen concentrated juice.

8/ Includes data for purchases rather than consumption of tea.

9/ Data are for purchases rather than consumption. For selected seasonings such as extracts, flavors, and meat sauce quantity is not included.

*Less than 0.005 dollar.

**Data not available.
